

AGRICULTURAL SENSOR STATION

Agricultural Sensor Station is a next-generation IoT sensor station that monitors soil and microclimatic conditions to optimize irrigation and protect crops from environmental risks. With real-time measurements above and below ground, it helps you prevent over-irrigation and plant water stress, while reducing costs and improving productivity.

Its sleek, cable-free design makes it easy to install, portable across seasons, and ready to use immediately with pre-calibrated sensors and an integrated long-life battery. Agricultural Sensor Station connects seamlessly with the Doktor App, giving you access to actionable insights, warnings, and recommendations from anywhere.

Enhanced Device Experience

01

- Sleek, wireless, and antenna-free design for easy installation.
- Pre-calibrated and ready to use immediately—no setup required.
- Integrated battery that ensures at least 3 years of operation.
- Advanced signal reception able to send data even with minimal cellular coverage.

Soil and Air Measurements

02

- Multi-level monitoring with both soil and air sensors in a single device.
- **Soil:** Moisture and temperature at 3 depths.
- **Air:** Rainfall, wind speed & direction, and light intensity at top level. Temperature and humidity at two different levels.

Irrigation Optimization & Benefits

03

- Real-time, precise soil data ensures accurate irrigation scheduling.
- Helps prevent over-irrigation and plant water stress.
- Increases productivity while reducing costs through smarter resource use.

Risk Management & Protection

04

- Early warnings for frost risk, low soil moisture, and high wind speed.
- Topple warning for consistent and hassle-free use in the field.
- Theft protection for added security.
